# REPROSHELL

## Core - Shell particles

Core-Shell particles consist of a solid (non-porous) core surrounded by a porous layer (shell). They exhibit the same back pressure but higher efficiency compared to fully porous particles of the same particle size.

# REPROSHELL

## ReproShell – van Deemter Equation

## van Deemter Plot

# REPROSHELL

## A-TERM (EDDY DIFFUSION, MULTI-PATH EFFECT)

Core-Shell particles have a tighter particle size distribution which leads to a more uniform, organised bed structure. This reduces the impact of the multi-path effect.

## B-Term (Longitudinal Diffusion)

### Fully porous particles:

Diffusion takes place within the porous particle as well as in the interstitial space

### Core-Shell particles:

Non-porous core blocks longitudinal diffusion

## C-Term (Mass transfer)

The non-porous core leads to a shorter diffusion path
